

## **Sentryo Joins IBM Security App Exchange Community To Help Build a Unified Approach to IT and OT Cybersecurity**

*Gives industrial organizations real-time visibility on security threats across both their enterprise IT and Operational Technology environments*

**Lyon, France, February 14, 2019** – SENTRYO, a pioneering developer of cybersecurity solutions for the Industrial Internet, today launched the Sentryo ICS CyberVision app for IBM QRadar, which leverages IBM security intelligence technology to help cybersecurity teams build a coordinated threat management strategy across both IT and industrial environments.

The cyber threats which make headlines every day are now targeting industrial networks and are impacting the real world in the form of production outage, environmental disaster or human safety. Sentryo's ICS CyberVision feeds the IBM QRadar Security Intelligence Platform with a detailed list of events, vulnerabilities and asset information from the company's industrial network to gain comprehensive visibility on the company's cybersecurity posture.

IBM QRadar ingests and analyzes data from Sentryo ICS CyberVision, along with other log, flow, user, asset and vulnerability data across an organization's IT infrastructure to identify security threats in real-time. Integrating QRadar and ICS CyberVision allows customers to access a unified view to visualize attacks based on both IT and industrial networks, the ability to correlate IT and OT events to quickly detect and remediate threats, to accelerate forensic investigations, to build comprehensive security reports, and more.

The Sentryo application for QRadar is freely available to the security community through IBM Security App Exchange, a marketplace where developers across the industry can share applications based on IBM Security technologies. As threats are evolving faster than ever, collaborative development amongst the security community will help organizations adapt quickly and speed innovation in the fight against cybercrime.

*"As industrial networks are embracing IT technologies and connected applications, they are more exposed to cyberattacks than ever. Enterprises of all sizes need to take cybersecurity measures to ensure continuity, resilience and safety of their industrial operations,"* explains Laurent Hausermann, Sentryo's COO and co-founder. *"Integrating Sentryo's ICS CyberVision with IBM QRadar allows corporations to manage cybersecurity as a whole, leveraging their skills and investments in their SOC to enable a safe migration to industry 4.0 technologies."*

**About Sentryo**

Sentryo is the pioneer in solutions dedicated to managing the cyber risk of M2M networks and industrial control systems. Sentryo's ICS CyberVision empowers control engineers as the front line of defense to ensure integrity, continuity and security of their industrial processes. It leverages unique AI algorithms to give them comprehensive visibility on their industrial assets, so they can easily identify vulnerabilities, detect anomalies in real time and work with IT to fight cyber-attacks. Sentryo's ICS CyberVision is used every day by large corporations in the energy, manufacturing and transportation markets. Sentryo is headquartered in France and has a worldwide presence including offices and partners in Europe, North and South America, Middle-East and Asia.
